Customer Behavior Analysis Using E-Commerce Data

Final Analysis and Business Recommendations

Anshika Chauhan

Data Science / Data Analytics Project

2026

Introduction

This report presents an analysis of customer purchasing behavior within an e-commerce dataset. The objective of the study is to identify patterns in user engagement, revenue distribution, and product category performance. By examining these aspects, the analysis aims to provide meaningful insights that can support better business decisions, particularly in areas such as customer retention, product strategy, and revenue optimization.

The findings are intended for stakeholders such as product managers, marketing teams, and business decision-makers who require clear and actionable insights derived from data.

Analytical Approach

The analysis was conducted in a structured manner, beginning with an understanding of the dataset and progressing toward deeper insights.

Initially, descriptive analysis was performed to examine the distribution of users, orders, and revenue. This was followed by identifying relationships between key variables such as purchase frequency and total revenue. Additional behavioral metrics, including Customer Lifetime Value (CLV), Average Order Value (AOV), and Purchase Frequency, were introduced to enhance the depth of analysis.

Finally, visualizations were used to simplify complex patterns and communicate findings in a clear and interpretable way.

Analytical Focus Areas

The analysis was guided by a few key focus areas to ensure that the findings remain relevant from a business perspective:

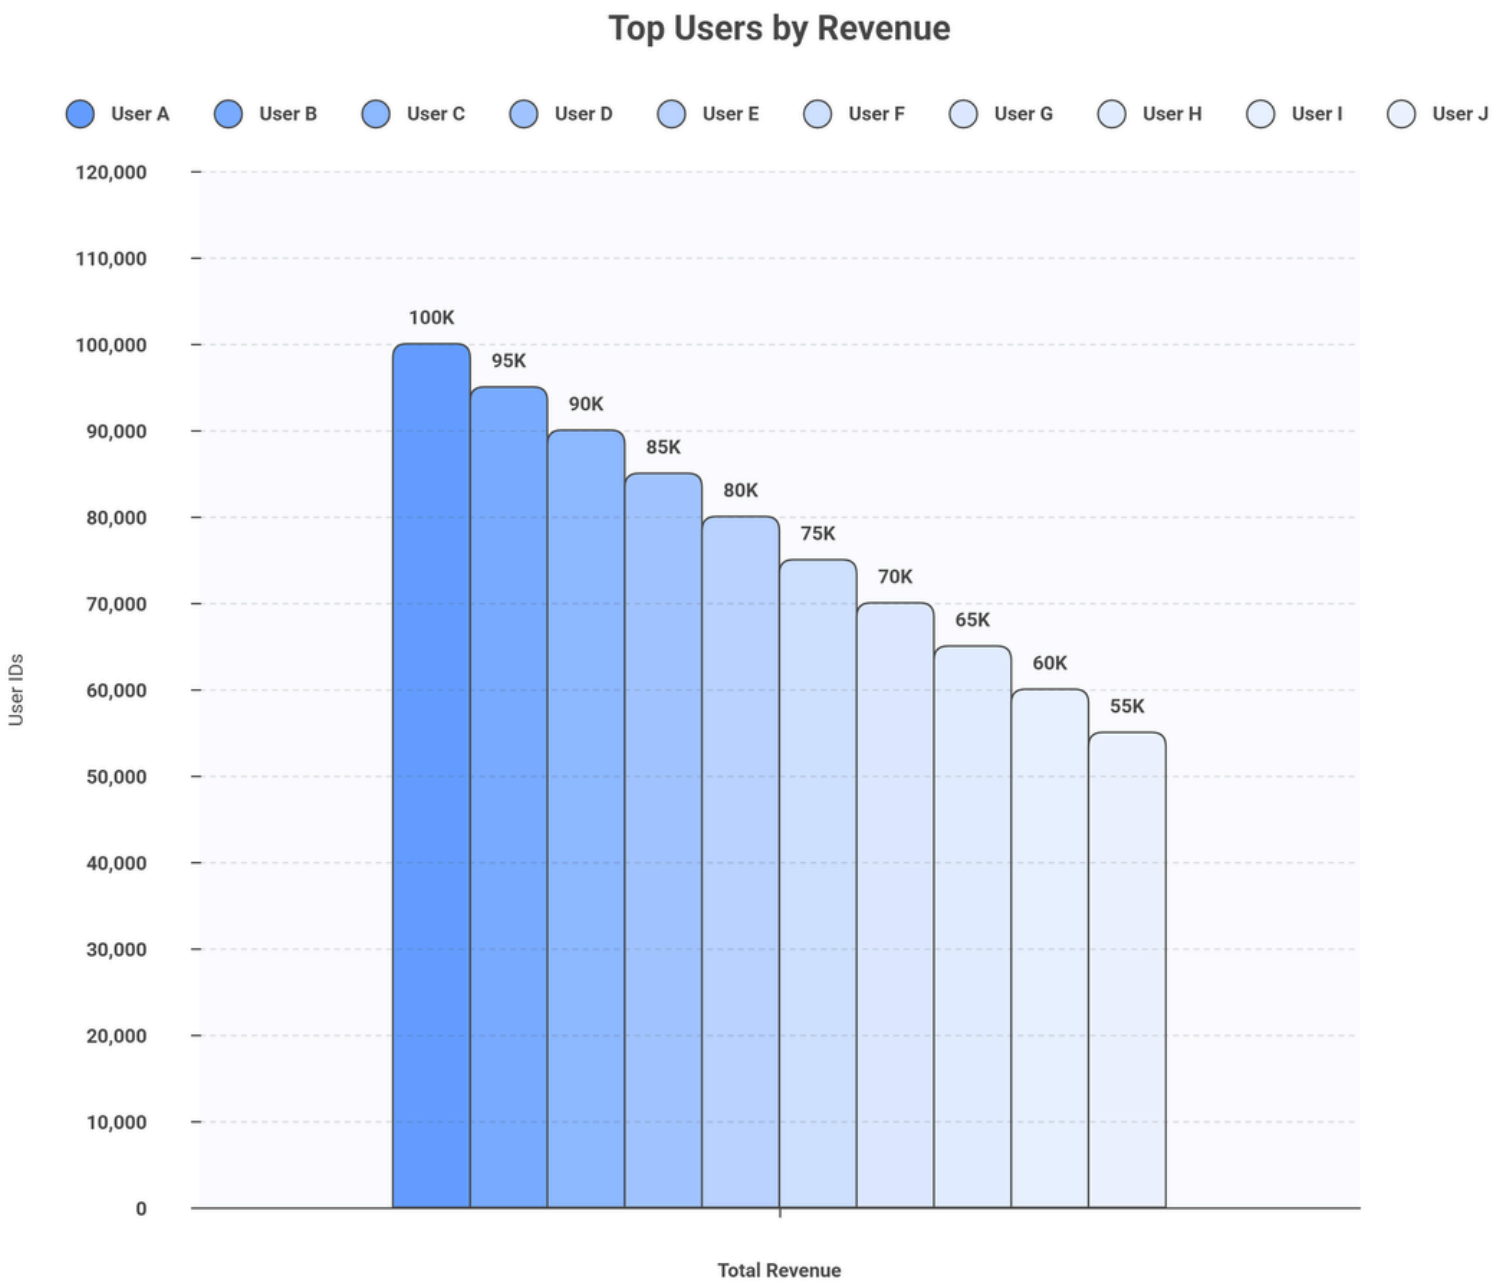
- **User-Level Analysis**
  Understanding how individual users contribute to total revenue and identifying high-value customers.
- **Behavioral Patterns**
  Examining purchase frequency and engagement levels to detect trends in user activity.
- **Revenue Drivers**
  Identifying the factors that influence revenue generation, including frequency and spending behavior.
- **Category-Level Performance**
  Analyzing how different product categories contribute to overall revenue.

These focus areas helped structure the analysis and ensured that insights were aligned with real-world business needs.

Revenue Distribution Among Users

A key observation from the analysis is that revenue is not evenly distributed across all users. Instead, a relatively small group of users contributes a disproportionately large share of the total revenue. This pattern indicates the presence of high-value customers who significantly influence overall business performance.

This uneven distribution highlights the importance of identifying and understanding top-performing users, as they represent a critical segment for retention and targeted engagement strategies.



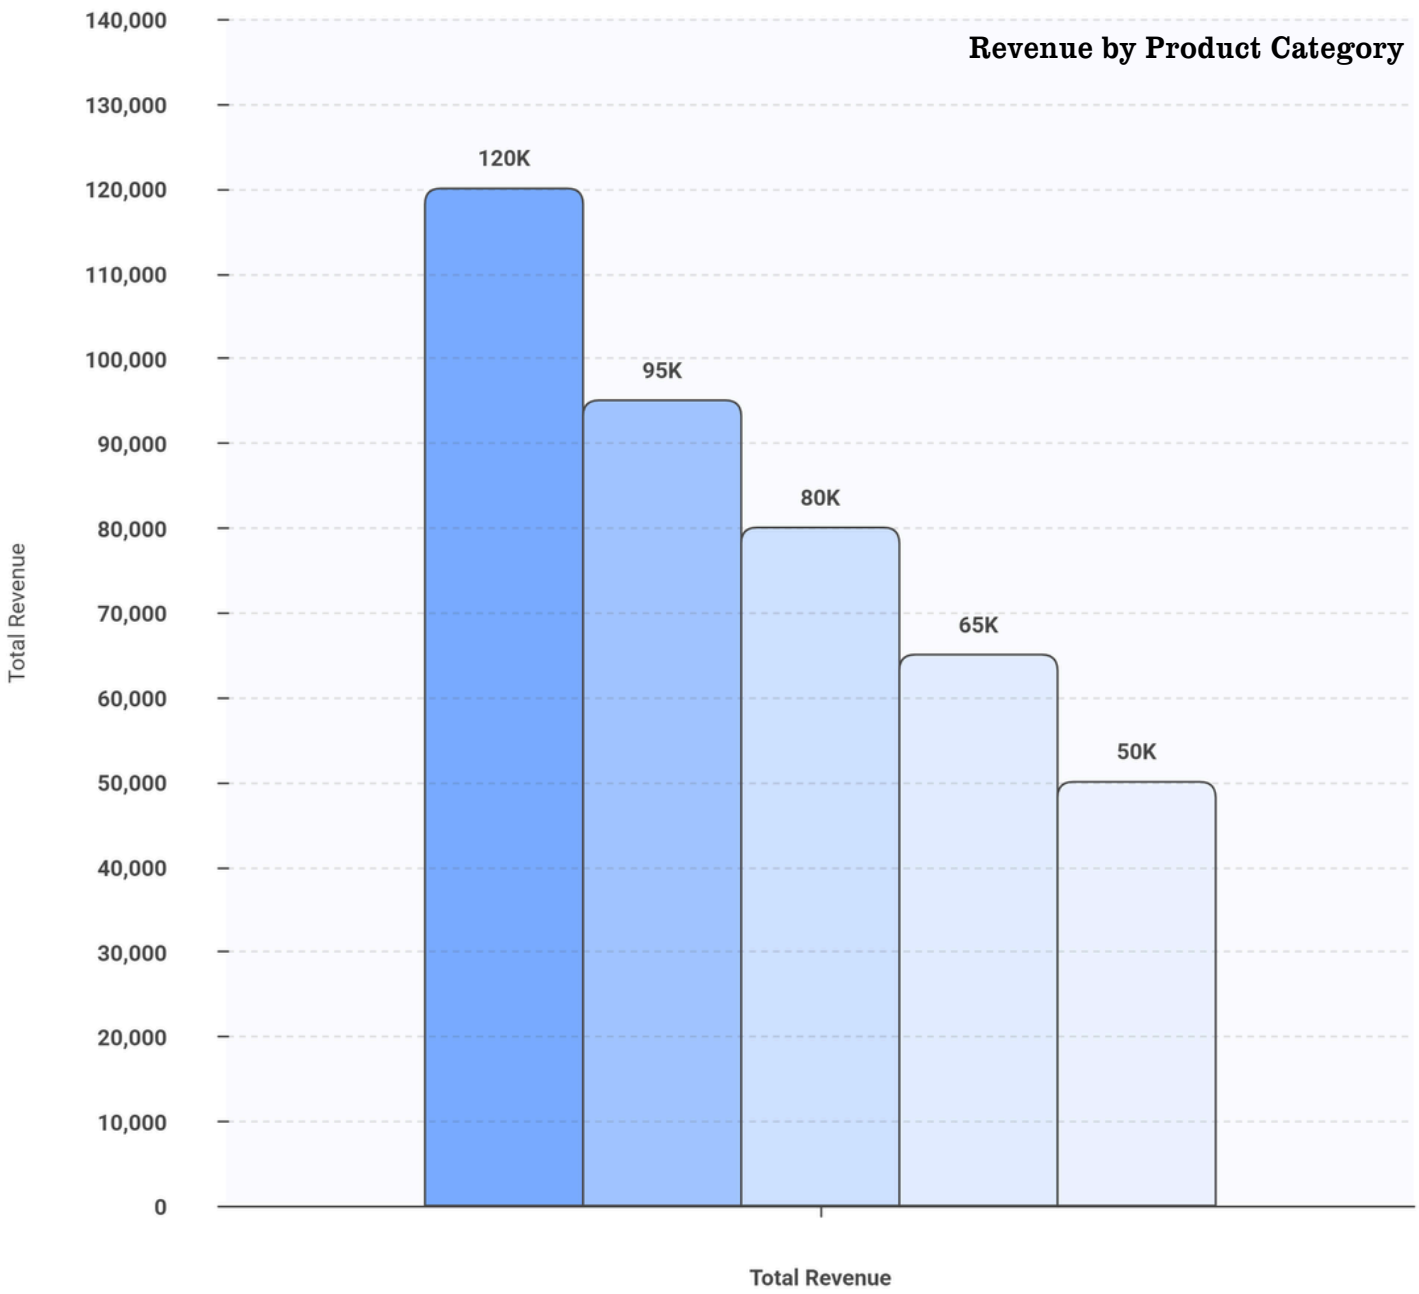
Interpretation:
The visualization clearly shows a declining trend in revenue contribution as we move from top users to the rest of the user base. The highest contributing users generate substantially more revenue compared to others, while the majority of users contribute relatively smaller amounts.
This indicates that revenue is concentrated among a limited number of users, reinforcing the idea that business performance is heavily dependent on retaining and engaging high-value customers.

Implications:
- High-value users should be prioritized in retention strategies
- Personalized marketing efforts can be targeted toward top contributors
- Identifying similar user profiles can help expand the high-value segment

Revenue Distribution Across Product Categories

Analyzing revenue across different product categories provides insight into which segments contribute most to overall business performance. The data reveals that revenue is not evenly distributed, with certain categories generating significantly higher revenue than others.

This variation highlights the importance of category-level analysis in understanding customer demand and optimizing product strategy

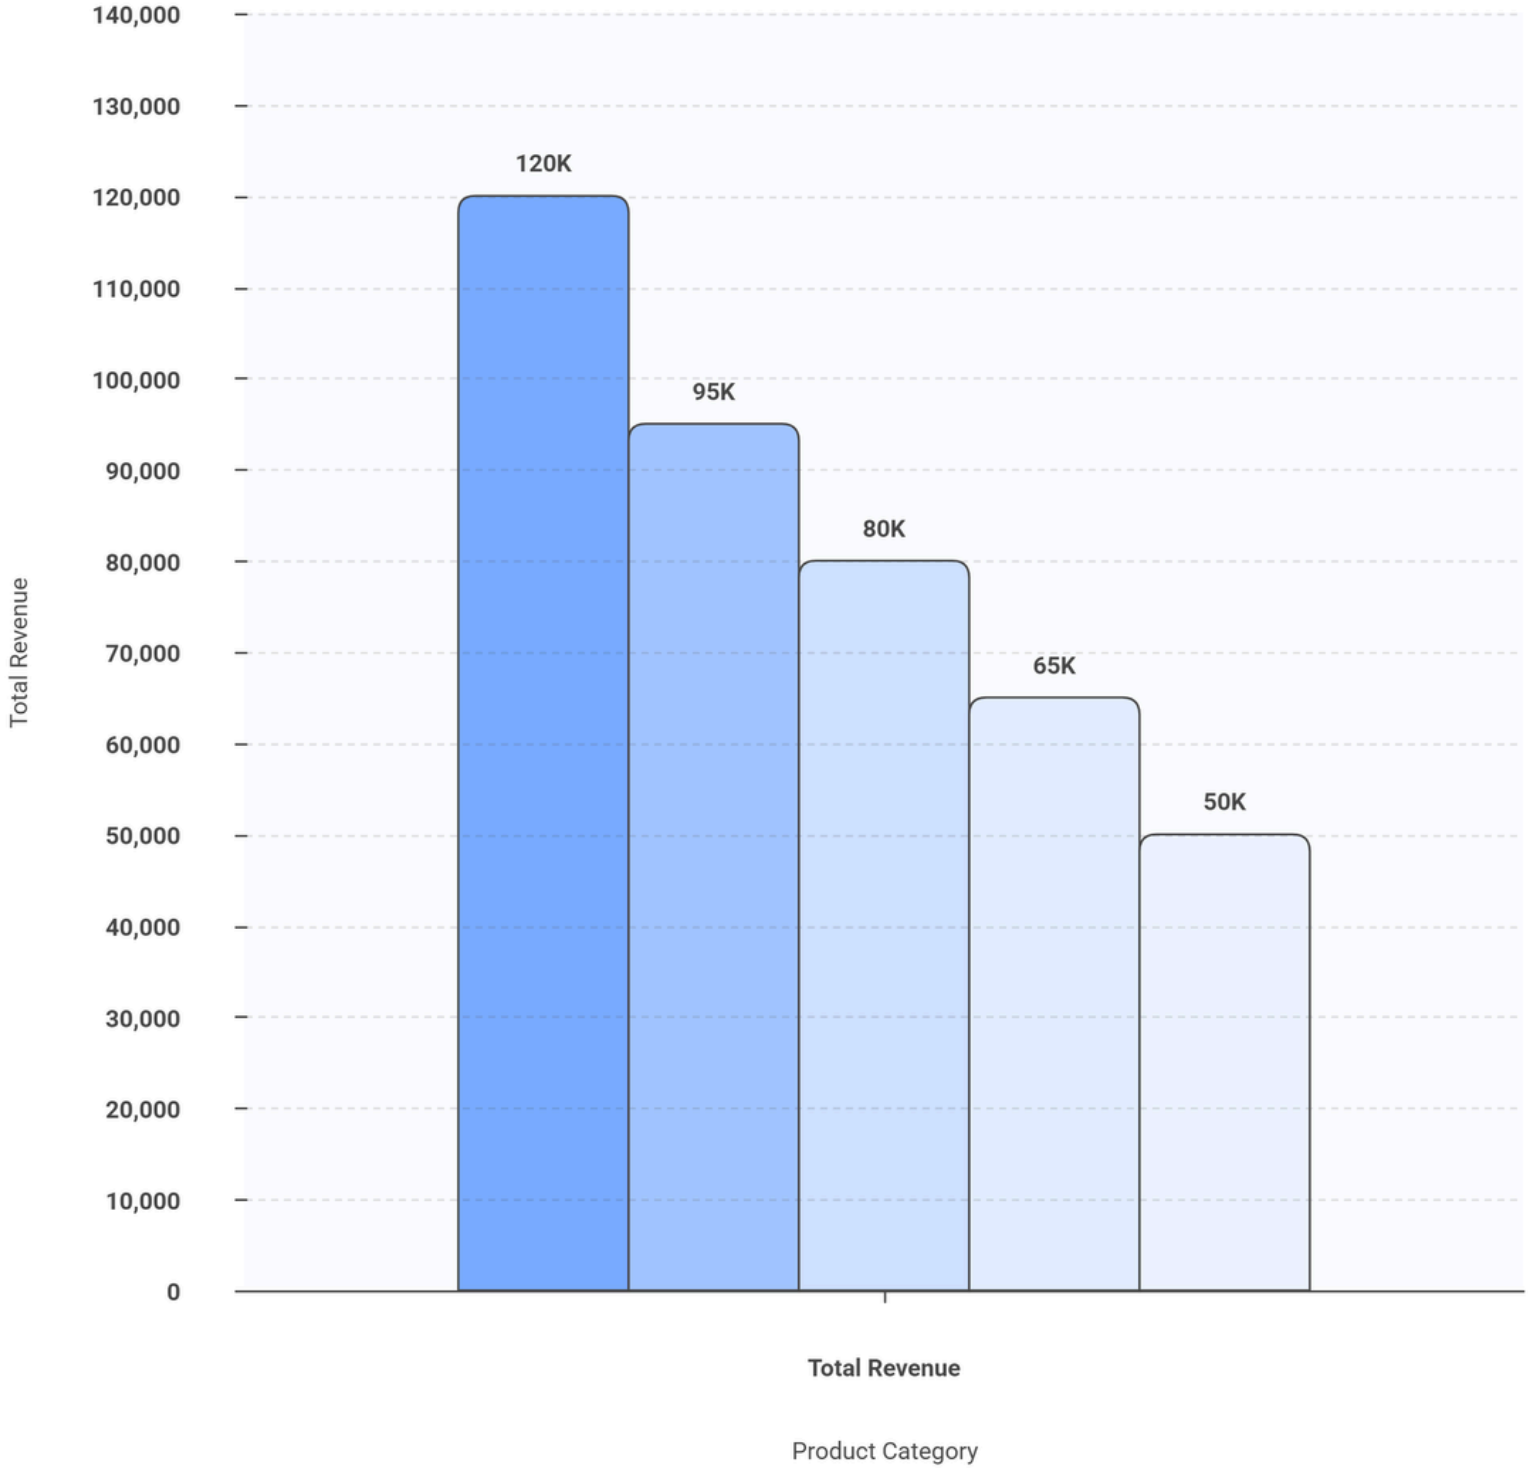


Interpretation:
The visualization shows that categories such as electronics and clothing contribute the highest share of revenue, while others like sports and beauty generate comparatively lower revenue.
This indicates that customer demand is concentrated in specific product segments, which play a dominant role in driving total sales.

Implications:

- High-performing categories should be prioritized for growth and investment
- Underperforming categories may require pricing or marketing adjustments
- Category-level insights can guide inventory and promotional strategies
- Focusing on top categories can maximize revenue efficiency

Data Visualization: Revenue by Product Category



Insight:
This chart shows that revenue is not evenly distributed across product categories. Electronics generates the highest revenue, followed by clothing and home-related products, while categories like sports contribute relatively less.
This indicates that certain product categories drive the majority of business revenue, highlighting opportunities for focused marketing, inventory planning, and category-level optimization.

Key Insights and Business Interpretation

The analysis highlights that customer behavior plays a critical role in driving revenue within the e-commerce platform. A small group of high-frequency users contributes a significant portion of total revenue, while the majority of users remain low-frequency purchasers.

Purchase frequency emerged as one of the strongest indicators of revenue generation, suggesting that encouraging repeat transactions is more effective than focusing solely on increasing individual order value. Additionally, product category analysis revealed that revenue is concentrated in a few key segments, indicating uneven demand across categories.

Overall, the findings show that revenue growth is closely linked to user engagement and retention rather than just customer acquisition.

Recommendations

Customer Strategy

- Focus on improving customer retention through loyalty programs
- Encourage repeat purchases using personalized recommendations
- Identify and target high-value users with tailored offers

- ***Product Strategy***
- Invest in high-performing product categories
- Optimize pricing and promotions for underperforming categories
- Align inventory with demand trends

- ***Engagement Strategy***
- Convert low-frequency users into repeat buyers through targeted campaigns
- Improve user experience to encourage continued interaction with the platform
- Use personalized communication (emails, offers, recommendations) to increase engagement

Next Steps

To build upon this analysis, several next steps can be considered:

- Develop customer segmentation models to identify different user groups
- Build predictive models to estimate customer lifetime value (CLV)
- Analyze time-based trends to understand retention and seasonal behavior
- Implement recommendation systems to improve product discovery

Conclusion

This analysis demonstrates that revenue generation in e-commerce is strongly influenced by user behavior, particularly purchase frequency and engagement levels. While a small group of users contributes significantly to revenue, a large portion of users remains under-engaged, representing an opportunity for growth.

By focusing on customer retention, improving engagement strategies, and optimizing product categories, businesses can enhance overall performance and achieve more sustainable growth.
